SUMMARY

Grand Canyon University BS in Artificial Intelligence student who designs, builds, and ships production AI agent systems end to end. Founder of AI Capital AI-con (in formation), a holding company for agent products and services, and an independent security researcher running a structured campaign under Google's Chrome Vulnerability Reward Program.

PROJECTS

Crew Memory Graph github.com/AI-conn/crew-memory-graph

- Three-agent crew (Planner, Researcher, Executor) sharing one persistent memory graph per tenant in FalkorDB, with episodic, semantic, and procedural memory layers and cross-process handoffs.
- Company question-answering that returns its evidence path through the graph; 25 tests passing and an internal benchmark at 14/14, including multi-hop questions.
- Public, MIT-licensed; entered in Graph Hacks (WeMakeDevs × FalkorDB hackathon), October 2026.

JobScout github.com/AI-conn/jobscout

- Job and internship finder agent: live web search, page fetching, and autonomous agent runs, with cross-portal deduplication and weighted match ranking that explains its reasons.
- Freshness re-checks keep listings current; public, MIT-licensed, 81 tests passing.

Kindred

- Taste-graph concierge agent built for the Qloo Agentic Hackathon ($25,000 pool, October 30, 2026 deadline).
- Build complete through two independent quality gates; 35/35 tests passing.

StockMandate

- Agentic-commerce prototype built for the PayPal AI Hackathon ($69,750 pool, November 12, 2026 deadline).
- Complete, tested prototype; 39/39 tests passing.

Chrome VRP Security Research Campaign

- Structured vulnerability-research program under Google's Chrome Vulnerability Reward Program: fuzzing lanes, source audit, and a crash-triage pipeline, run entirely on my own machines and builds.
- Independent research run alongside full-time study.

Self-Built AI Fleet and Station

- A personal fleet — desktop tower and laptop running local open-weight models, plus cloud agent seats and a custom station/dashboard layer — coordinated by an AI chief-of-staff I configured and direct daily.
- The fleet researches, builds, tests, and ships real products; every project above came out of it. Built because I wanted leverage that compounds.

SKILLS

Languages: Python, TypeScript/JavaScript

Agent systems: multi-agent orchestration, tool use, Model Context Protocol (MCP)

Data: FalkorDB, Cypher, knowledge graphs, agent memory systems

Back ends: Flask, REST API design and integration

Local LLM operations: Ollama/GGUF deployment, model evaluation and routing across local and frontier models

Tooling: Git/GitHub; every project above is a public, licensed, tested repository

EDUCATION

Grand Canyon University — BS in Artificial Intelligence (in progress)
